

Much of our upgrades for the 2010 SportJon were the result of customer input. Flotation and higher sides have been requested regularly. This came together for us like a light bulb moment because of our effort to continually improve our boats bottom strength.

Expanded polystyrene was the perfect answer for the flotation. Unlike spray-in foams used in the past, this product will not absorb moisture. It is also very flame retardant which allows us to fit our floor channels very tightly and then weld them in with minimum shrinkage.

The extra two inches we added to the side height allowed us to install over 20 cubic feet of foam in the 2010 SportJon. All this was accomplished with no increase in total weight or cost to you.
